## STRATEX CORE — NEXTGEN ARCHITECTURE REVIEW APPENDIX

Q1 — TWENTY-FOUR-AGENT ARCHITECTURE (justification)

Correction of framing

Per-agent detail table

Combination rationale

Q2 — PROPERTY PASSPORT AUTHORITY

Ownership model (definitive)

Access-control matrix

Existing Claim Snapshot cosign receipt pattern (§8 blueprint) is the canonical template for how every future append works.

Q3 — PROVENANCE INTERFACE

Visual-noise avoidance rules

Provenance vs Confidence vs Truth Score (clarified)

Q4 — TRUTH SCORE (honest specification)

Definition (revised, non-marketing)

Component inputs

Weighting

Missing-evidence behavior

Contradictory-evidence behavior

Human verification effect

Versioning

Calibration

Display language rules

Marketing restrictions

The four levels distinguished

Q5 — AWE™ MISSION SEPARATION

Recognized: AWE requires a separate mission

Product 1 · **Stratex Core DayScan™**

Product 2 · **Stratex AWE™ Scan**

Product 3 · **Stratex Elite™ Property Intelligence**

Mission planner enforcement

Q6 — DIGITAL TWIN ARCHITECTURE

Canonical decisions

Stratex-owned vs external-processor-owned

Q7 — DATA-STATE HONESTY

Adopted implementation-state vocabulary

Marketing rules

Q8 — EXISTING ASSET PRESERVATION MAP

Q9 — SECURITY SCOPE (phased introduction)

Phase 1 (Foundation)

Service-to-service authorization

Audit logging

Secrets management

Rate limiting

File access

Explicit Phase 1 stops

Q10 — DATABASE-DOMAIN JUSTIFICATION

Per-domain table

Q11 — API-PLANE JUSTIFICATION

Per-plane table

Q12 — EVENT-DRIVEN ARCHITECTURE (Phase 1 events only)

Phase 1 minimum viable event set

Q13 — TECHNOLOGY DECISIONS (justified)

Rejected in this round

Q14 — PHASE 1 SCOPE CONTROL (explicit)

Phase 1 SHALL establish (deliverable list)

Phase 1 SHALL NOT claim to deliver

Success criteria (Phase 1 exit gate)

APPENDIX — REVISION HISTORY

# STRATEX CORE — NEXTGEN ARCHITECTURE BLUEPRINT

**Version:** 1.0 · **Status:** DRAFT · Awaiting Executive Approval

**Author:** TC · Stratex AI Product Manager · Under directive of Anthony Cross

**Directive Reference:** STRATEX CORE DIRECTIVE 001 — Legacy Freeze & NextGen Rebuild

**Design principle:** *Optimize for correctness of architecture, not speed of completion.*

## 0. EXECUTIVE FRAMING

Stratex Core NextGen is **not** a drone-inspection app.

It is the **Residential Property Intelligence Operating System** — an enterprise-grade mission-control platform that orchestrates hardware, AI, human review, and permanent data custody across three fused pillars:

| PILLAR               | PURPOSE                                                                    |
|----------------------|----------------------------------------------------------------------------|
| **Stratex Core**     | Contractor operating system — mission, capture, intelligence, delivery     |
| **Stratex Passport** | Permanent, hash-chained property intelligence record — the source of truth |
| **Stratex Habitat**  | Homeowner-facing intelligence platform                                     |

The drone is **one sensor among many**. The AI workforce performs the intelligence.

The Property Passport is the permanent source of truth. Habitat is the homeowner face.

**Mandatory architectural workflow — no module bypasses this chain:**

```
Mission Control → Mission Planning → Mission Validation → Flight →
Mission Assurance → Capture Validation → Digital Twin Generation →
AI Workforce Processing → Property Intelligence → AWE™ Intelligence →
Human QA → Report Generation → Property Passport Update →
Habitat Synchronization → Customer Delivery
```

## 1. APPLICATION STATE MODEL

Three formally separated states co-exist in the codebase:

| STATE          | LOCATION                                  | DEPLOY TARGET                  | MODIFIABLE?            | PURPOSE                                      |
|----------------|-------------------------------------------|--------------------------------|------------------------|----------------------------------------------|
| **PRODUCTION** | `stratexdrone.com`                        | Frozen at last approved deploy | No — read-only         | Customer-visible; unchanged during rebuild   |
| **NEXTGEN**    | `stratex-quant.preview.emergentagent.com` | Active dev                     | **Yes** — all new work | Rebuild target                               |
| **LEGACY**     | `/legacy/*` namespace inside preview      | Not deployable to prod         | Read-only after freeze | Rollback, comparison, knowledge preservation |

### Migration rules — irreversible until parity

Legacy is **never deleted** until ALL of the following pass:

1. Replacement complete
2. QA passed
3. APIs migrated
4. Data migration verified
5. Passport sync verified
6. Habitat sync verified

- 7. Reports validated
- 8. Navigation validated
- 9. AI workflows validated
- 10. Regression suite passed

---

## 2. MODULE HIERARCHY

---

The NextGen platform is organized into **14 first-class modules** grouped under 4 layers.

### Layer I — Operations (mission execution)

- 1. **Mission Control** — command deck; live global state; alerts; fleet status
- 2. **Mission Planning** — waypoint design, mission templates, geofencing, altitude profiles
- 3. **Mission Validation** (*formerly Air Traffic Control*) — 20-item preflight hard gate; blocks launch on any failure
- 4. **Flight Operations** — live telemetry, breadcrumbs, in-air observability
- 5. **Mission Assurance** — in-flight QA agent; monitors capture density, GSD, overlap; requests additional shots before landing
- 6. **Capture Validation** — post-flight ingestion; radiometric integrity checks; RGB/thermal registration verification

### Layer II — Intelligence (data → insight)

- 1. **Digital Twin Studio** — 3-model workspace (Reality Capture · Engineering CAD/BIM · Property Intelligence)
- 2. **AI Workforce** — orchestration console for the ~20 specialized agents (see §5)
- 3. **Property Intelligence** — canonical property record view; systems (roof, walls, windows, doors, HVAC, ventilation)
- 4. **AWE™ Intelligence** (*new pillar*) — **Air · Water · Energy** — cross-cutting environmental performance analytics
- 5. **Human QA** — review + approval console; every AI finding requires human sign-off before it enters the Passport

### Layer III — Delivery

- 1. **Report Studio** — configurable enterprise deliverables; every value carries provenance chip
- 2. **Property Passport** — immutable hash-chained ledger; native module today; extractable to standalone service in Phase 5
- 3. **Habitat Sync** — outbound sync of approved data to the homeowner platform

### Layer IV — Platform

- **Identity & Access** — auth, roles, org tenancy, audit
- **Integrations** — DJI, weather, FAA airspace, materials/labor DBs, payments
- **System Console** — health, keys, feature flags, sync queues

---

## 3. NAVIGATION HIERARCHY (canonical)

---

Single persistent operator shell. No hidden orphans.

|                     |                                                                                                                                                                                                                                                                                                                                                |

```
| · Sync Queues & Health
| · Feature Flags
| · Settings
|
└─ LEGACY (hidden, read-only) ───────────
    · /legacy/* – all pre-NextGen screens for reference
```

Every route below the top-level module MUST be reachable from the persistent left nav

OR from a canonical entity detail view. **No orphaned URLs.**

4. DATABASE DOMAINS

The current single-tenant, dict-based Mongo layer is replaced by **10 typed domains**, each with Pydantic document models, `to_mongo()` / `from_mongo()` helpers, and enforced `created_at` / `updated_at` / `created_by` / `org_id` audit fields.

Domain 1 · Identity & Access

| COLLECTION     | PURPOSE                                  |
|----------------|------------------------------------------|
| `orgs`         | Multi-tenant root                        |
| `users`        | Human accounts                           |
| `roles`        | RBAC definitions                         |
| `sessions`     | JWT session ledger                       |
| `api_keys`     | Machine tokens                           |
| `audit_events` | Every mutation with actor + before/after |

Domain 2 · Property Registry

| COLLECTION              | PURPOSE                                                      |
|-------------------------|--------------------------------------------------------------|
| `properties`            | Canonical property record (parcel, address, geo)             |
| `addresses`             | Normalized street/city/state/zip                             |
| `parcels`               | County-parcel linkage                                        |
| `owners`                | Legal + occupant ownership records                           |
| `contractors`           | Contractor profiles (replaces scattered `_contractor` dicts) |
| `property_org_bindings` | Which orgs may access which properties                       |

Domain 3 · Mission Operations

| COLLECTION            | PURPOSE                           |
|-----------------------|-----------------------------------|
| `missions`            | Formal mission record             |
| `mission_plans`       | Waypoints, altitude, camera plans |
| `mission_validations` | ATC 20-item results               |
| `mission_telemetry`   | In-flight breadcrumbs             |
| `capture_sessions`    | Post-flight ingest records        |

**Domain 4 · Capture Assets (object storage)**

| COLLECTION          | PURPOSE                                                                     |
|---------------------|-----------------------------------------------------------------------------|
| `assets`            | Metadata for RGB, thermal, video, twin exports; body in S3-compatible store |
| `asset_derivatives` | Downsamples, PNG previews, cropped tiles                                    |
| `asset_provenance`  | Chain-of-custody per asset                                                  |

**Domain 5 · Intelligence Findings**

| COLLECTION           | PURPOSE                                                                     |
|----------------------|-----------------------------------------------------------------------------|
| `findings`           | Every AI/human finding — one row per anomaly / measurement / classification |
| `finding_evidence`   | Links to source assets + regions                                            |
| `finding_confidence` | Model + confidence + version + provenance                                   |
| `agent_runs`         | Every AI invocation with input hash, output, cost, model version            |

**Domain 6 · AWE™ Metrics**

| COLLECTION     | PURPOSE                                     |
|----------------|---------------------------------------------|
| `awe_readings` | Per-inspection Air/Water/Energy readings    |
| `awe_scores`   | Composite AWE score per property/inspection |
| `awe_history`  | Longitudinal AWE trend per property         |

**Domain 7 · Estimating**

| COLLECTION          | PURPOSE                                  |
|---------------------|------------------------------------------|
| `materials_catalog` | SKU, unit, unit price by region          |
| `labor_catalog`     | Trade, rate, region                      |
| `estimates`         | Estimate documents linked to inspections |
| `estimate_versions` | Immutable revisions                      |

**Domain 8 · Reports & Deliverables**

| COLLECTION          | PURPOSE                               |
|---------------------|---------------------------------------|
| `report_templates`  | Versioned templates                   |
| `reports`           | Rendered report records               |
| `report_versions`   | Every render with provenance snapshot |
| `report_signatures` | Human approvals                       |

**Domain 9 · Passport & Habitat Sync**

| COLLECTION          | PURPOSE                                                    |
|---------------------|------------------------------------------------------------|
| `passport_ledger`   | Hash-chained immutable ledger (existing, migrated + typed) |
| `passport_sync_log` | Outbound sync audit trail                                  |
| `habitat_sync_log`  | Habitat-bound events                                       |
| `sync_retry_queue`  | Failed sync retries with backoff                           |

Domain 10 · Compliance & Observability

| COLLECTION         | PURPOSE                                          |
|--------------------|--------------------------------------------------|
| `provenance_chain` | Every value's derivation lineage                 |
| `event_log`        | Immutable event bus record                       |
| `error_events`     | Exceptions with correlation IDs                  |
| `cost_ledger`      | AI + storage + compute cost per mission/property |

5. AI WORKFORCE ARCHITECTURE

Every agent conforms to a strict contract:

```
class Agent(Protocol):
    id: str          # e.g. "roof-intel-v2"
    version: str     # semver
    inputs: JsonSchema # required + typed
    outputs: JsonSchema # always includes: value, confidence, evidence_ids, provenance
    model: str       # e.g. anthropic/claude-sonnet-4-6
    prompt_version: str # hash of the prompt template
    cost_estimate_usd: float
    human_gate_required: bool
```

Agent registry

| #  | AGENT                        | RESPONSIBILITY                                  | CONFIDENCE SOURCE          | HUMAN GATE          |
|----|------------------------------|-------------------------------------------------|----------------------------|---------------------|
| 1  | **Mission Commander**        | Compose + validate mission plan                 | Rule-based + Claude        | Yes                 |
| 2  | **Mission QA**               | ATC 20-item gate                                | Deterministic checks       | No (all-or-nothing) |
| 3  | **Flight Operations**        | Live telemetry watch, safe-return decisions     | Rule-based                 | Escalates to human  |
| 4  | **Mission Assurance**        | In-flight capture density QA                    | GSD/overlap math           | No (auto-retake)    |
| 5  | **Capture Validation**       | Radiometric integrity, RGB/thermal registration | Statistical + Claude       | Yes                 |
| 6  | **Photogrammetry**           | Point-cloud + mesh generation                   | AWAITING INTEGRATION       | Yes                 |
| 7  | **Thermal Analysis**         | Radiometric anomaly detection                   | Model + statistical        | Yes                 |
| 8  | **CAD/BIM Generation**       | Structural layers, framing extraction           | AWAITING INTEGRATION       | Yes                 |
| 9  | **Digital Twin**             | Fuse 3 layers into single twin                  | Deterministic composition  | Yes                 |
| 10 | **Roof Intelligence**        | Roof plane, facet, damage classification        | CV + Claude                | Yes                 |
| 11 | **Window Intelligence**      | Window type, dimensions, glass, leakage         | CV + Claude                | Yes                 |
| 12 | **Door Intelligence**        | Door type, material, seal condition             | CV + Claude                | Yes                 |
| 13 | **Water (AWE)**              | Moisture retention, roof water risk             | Thermal + Claude           | Yes                 |
| 14 | **Air (AWE)**                | Ventilation performance, leakage paths          | Thermal + Claude           | Yes                 |
| 15 | **Energy (AWE)**             | Envelope performance, heat-loss score           | Thermal + Claude           | Yes                 |
| 16 | **Damage Detection**         | Anomaly clustering across all systems           | CV + Claude                | Yes                 |
| 17 | **Measurement Intelligence** | Extract precise measurements from twin          | Deterministic geometry     | Yes                 |
| 18 | **Materials Intelligence**   | Compose BOM with confidence                     | Catalog + Claude           | Yes                 |
| 19 | **Labor Intelligence**       | Compose labor plan                              | Catalog + Claude           | Yes                 |
| 20 | **Estimating Intelligence**  | Final estimate with waste, tax, O&P             | Deterministic math         | Yes                 |
| 21 | **Maintenance Priority**     | Rank issues by urgency + cost avoidance         | Composite scoring          | Yes                 |
| 22 | **Reporting Intelligence**   | Compose enterprise report                       | Template + Claude narrator | Yes                 |
| 23 | **Passport Sync**            | Emit ledger delta to Passport service           | Deterministic              | No                  |
| 24 | **Habitat Sync**             | Emit homeowner packet to Habitat                | Deterministic              | No                  |

Absolute rules (non-negotiable)

- 1. No agent may fabricate a measurement. If input is insufficient, output must be `null` + reason.
- 2. Every output carries `confidence_pct`, `evidence_ids[]`, `provenance{}`.
- 3. Every human-gated finding is BLOCKED from entering the Passport until QA approves.
- 4. Every agent run is written to `agent_runs` with input hash, output, cost, model version, prompt version — permanent audit.
- 5. Cost caps per property + org — hard-stop when exceeded.

6. API BOUNDARIES

Five formal API planes, each with its own auth, rate limits, and versioning.

| PLANE               | PREFIX                       | AUDIENCE                             | AUTH                 |
|---------------------|------------------------------|--------------------------------------|----------------------|
| **Public Read API** | <code>/api/pub/v1/</code>    | Anonymous (via passport hash)        | Signed URL / hash    |
| **Product API**     | <code>/api/v1/</code>        | Authenticated users                  | JWT + org context    |
| **Agent API**       | <code>/api/agents/v1/</code> | Backend agent runners only           | Service token        |
| **Sync API**        | <code>/api/sync/v1/</code>   | Passport + Habitat services          | mTLS + service token |
| **Webhook API**     | <code>/api/hooks/v1/</code>  | External inbound (DJI, FAA, weather) | HMAC signature       |

All existing routes at `/api/passport/`, `/api/claim-snapshot/`, `/api/mission-control/*` are preserved under legacy compatibility shims that forward to the new plane 1:1 during the parity window.

7. EVENT FLOW & STATE MANAGEMENT

Event-driven backbone. Every domain mutation emits an immutable event to `event_log`.

Downstream consumers subscribe by event type.

|                                |                               |
|--------------------------------|-------------------------------|
| <code>mission.planned</code>   | → validates mission           |
| <code>mission.validated</code> | → unlocks flight              |
| <code>flight.completed</code>  | → triggers capture_validation |
| <code>capture.validated</code> | → schedules AI workforce runs |
| <code>finding.produced</code>  | → notifies human_qa           |
| <code>finding.approved</code>  | → passport.ledger.append      |
| <code>passport.updated</code>  | → habitat.sync.request        |

Frontend state: **React Query** for server state + **Zustand** for local UI state.

Rejected — Redux (too much ceremony), Recoil (deprecating), unmanaged local state (current problem).

8. SYNCHRONIZATION FLOW

- **Idempotency**: every sync carries a UUID; duplicate reception is a no-op
- **Ordering**: strict per-property via sequence numbers
- **Retry**: exponential backoff to `sync_retry_queue`
- **Audit**: every attempt logged to `passport_sync_log` / `habitat_sync_log`
- **Cryptographic receipt**: SHA-256 over the payload, written into the ledger

(already implemented for the Claim Snapshot co-sign — reuse the pattern)

---

## 9. SECURITY MODEL

---

### Identity

- JWT (short-lived) + refresh tokens
- MFA required for CEO + admin roles
- SSO (SAML / OIDC) — AWAITING INTEGRATION (Phase 5)

### Authorization

- **RBAC**: CEO · GM · Contractor · Inspector · Pilot · Homeowner · Adjuster · Service
- **ABAC overlay**: property-level access via `property_org_bindings`
- Every API call enforces: `authorize(user, action, resource)`

### Data protection

- Passport ledger: hash-chained (already implemented)
- Cryptographic receipts on all critical writes (already implemented for co-sign)
- Field-level encryption on PII (address, owner name, contact) using envelope encryption
- Object storage: signed URLs with expiry; per-org bucket isolation

### Provenance chain

Every value shown to a user must resolve to a `provenance{}` record answering:

1. **Source** — sensor, agent, human, calculation
2. **Confidence** — 0-100 or "verified"
3. **Version** — model version, prompt version
4. **Timestamp** — captured, computed, approved
5. **Signer** — if human-approved, who + when

### Observability

- Sentry (frontend + backend) — AWAITING INTEGRATION
- Structured logs (JSON, trace-id correlated)
- Distributed tracing via OpenTelemetry — AWAITING INTEGRATION
- Health probes: `/healthz`, `/readyz`, `/livez`

---

## 10. DEPLOYMENT MODEL

---

Three environments, promoted linearly:

```
NextGen preview → Staging → Production (stratexdrone.com)
```

- Every deploy requires: passing `iter-xx` regression suite + human sign-off
- **Blue/green** at the Emergent ingress layer
- **Rollback**: existing Emergent checkpoint feature (no code needed)
- **Feature flags**: LaunchDarkly or open-source alternative — AWAITING INTEGRATION
- **CI/CD**: pushed to Emergent-managed pipeline; supplemented by repo-side lint/test workflow — AWAITING INTEGRATION

Object storage (S3-compatible) required for asset domain — **AWAITING INTEGRATION**.

---

## 11. VISUAL DESIGN PRINCIPLES

---

Not negotiable. Every screen must pass this rubric:

### Aesthetic pillars

1. **Mission-control system**, not a form-flow app
2. **Dark graphite base** — never white primary
3. **Glass panels** — 12-24px backdrop blur, subtle stroke
4. **Teal illumination** as anchor color (`#00E5FF`)
5. **Orange highlights** as accent (`#FF7B00`)
6. **Gold ceremonial** for approvals (`#D4B86A`)
7. **Magenta for urgency** (`#FF2D78`)
8. **Green for validated** (`#00FF9C`)
9. **Typography**: Sora display · Space Grotesk body · JetBrains Mono for data
10. **Generous negative space** — 2-3× typical SaaS density
11. **Cinematic motion** — reveal choreography, no boring transitions
12. **Provenance chip on every meaningful value** (mandatory shared component)

### Anti-patterns (forbidden)

- Purple/violet gradients on white
- Generic card grids with equal padding
- Emoji as functional icon (allowed only in written narrative)
- Placeholder Lorem Ipsum
- Any dashboard tile that shows a mock number without a `MOCK` chip

### Provenance chip specification

Every displayed value shall carry one of the following badges:

-  **MEASURED** — from a physical sensor
-  **CALCULATED** — from measured inputs
-  **ESTIMATED** — from a model with confidence <95%
-  **VERIFIED** — human QA approved
-  **AI-ASSISTED** — model output pending human QA
-  **AWAITING INTEGRATION** — capability shipping in a future phase
-  **DEMO DATA** — visible in prototype builds only

---

## 12. EXECUTIVE ARCHITECTURE REVIEW

---

Per your directive: *"Do not assume the architecture is perfect. Critique it."*

### Strengths

1. **Passport hash chain is genuinely defensible** — cryptographic tamper-evidence is rare in this industry
2. **Cosign SHA-256 receipt pattern is reusable** across every human sign-off in the platform
3. **Storm → calendar bridge + Open-Meteo integration** proves the platform can react to real-world events
4. **PDF pipeline is production-grade** — Playwright + cache-first design already survives Emergent K8s
5. **Emergent LLM Key + `emergentintegrations`** eliminates vendor lock-in on AI

### Weaknesses

1. **Monolithic `server.py`** (2,684 lines) — will not survive scale; must be broken into per-domain routers
2. **No canonical property model** — the single `property_passports` document does too much
3. **Zero product-route auth** — the biggest deployment risk today

4. **No object storage** — PDFs and images live on ephemeral disk
5. **AI orchestration is ad-hoc** — no agent registry, no cost ledger, no prompt versioning
6. **No frontend TypeScript** — 50 pages of unchecked JS across a growing platform
7. **No test coverage on the UI** — regressions are only caught by the testing subagent

### Technical debt (top-priority)

- Break `server.py` (P0)
- Add `require_auth` to every product route (P0)
- Introduce Pydantic doc models per collection (P0)
- Add object storage (P1)
- Formal event log (P1)
- Prompt version manager (P1)
- Frontend TypeScript migration (P2)
- OpenTelemetry tracing (P2)

### Risks

1. **DJI SDK is closed** — the Matrice/Manifold/Dock integration will require an NDA and a licensed developer account. Timeline unknown.
2. **Photogrammetry / CAD-BIM** — no open-source pipeline meets enterprise quality; likely commercial (Bentley ContextCapture, Pix4D, Reality Capture). Cost pressure.
3. **Real thermal ingest** — radiometric R-JPG parsing needs FLIR/DJI SDK. Not free.
4. **Multi-tenant refactor** — every existing query must be rewritten. High regression risk.
5. **Ledger migration** — moving the existing Bingham passport into normalized rows must preserve every hash — mistakes here are unrecoverable.

### Missing integrations (formally declared)

- FAA LAANC airspace
- DJI Cloud API + FlightHub 2
- Manifold 3 edge compute
- Photogrammetry pipeline
- CAD/BIM generator
- Materials + labor DB (regional pricing)
- Object storage (S3-compatible)
- Sentry / OpenTelemetry
- Habitat platform (its own service)
- SSO (SAML / OIDC)

### Performance concerns

1. `/api/storms/active` is  $O(N \text{ passports} \times 1 \text{ external HTTP call})$  — must be batched + cached
2. Passport ledger unbounded growth — no compaction strategy
3. PDF cache is not shared across replicas — will race on scale-out
4. No pagination in list endpoints — will fail beyond 1k records

### Security concerns

1. Public passport URL leaks all passport data to anyone with the hash — must move to signed URLs
2. Cosign token generation has no per-passport race guard
3. No CSRF on state-changing endpoints
4. WebSocket accepts any client — needs authenticated handshake

### Scalability concerns

1. Single Mongo instance, no replica set — no HA
2. Single uvicorn worker — no horizontal scaling
3. Static file serving from same process as API — must move to CDN

Recommended improvements

- 1. **Event sourcing** for the intelligence pipeline — every finding derives from an immutable event chain
- 2. **CQRS split** — reads from denormalized projections, writes to normalized commands
- 3. **Agent-as-a-service** pattern — every agent runs as an idempotent HTTP endpoint
- 4. **Feature flags** for every AWAITING INTEGRATION capability so we can flip them on without deploys
- 5. **Contract-first API design** — publish OpenAPI specs before implementation for every new endpoint

13. PHASE 1 DELIVERABLE MAP (traceability)

Mapping this blueprint to the seven Phase 1 acceptance criteria you set:

| CRITERION                        | DELIVERABLE                                                                            | SECTION                |
|----------------------------------|----------------------------------------------------------------------------------------|------------------------|
| 1. Deployable NextGen Preview    | Working <code>/nextgen/*</code> route tree with shell + workspace stubs on preview URL | Implementation phase   |
| 2. Architecture Blueprint        | <b>**This document**</b>                                                               | \$1-\$12               |
| 3. System Flow Validation        | Workflow chain diagram + per-stage stub route                                          | \$0 workflow + \$3 nav |
| 4. Visual Design Review          | Screenshots of every workspace in the shell                                            | Implementation phase   |
| 5. AI Workforce Map              | 24-agent registry table                                                                | \$5                    |
| 6. Executive Architecture Review | Strengths · weaknesses · debt · risks · improvements                                   | \$12                   |
| 7. Final deliverable             | Preview + all above docs bundled + sign-off form                                       | Post-implementation    |

14. WHAT MUST NOT BE BUILT YET (Phase 1 forbidden list)

To maintain architectural correctness over speed, these are **explicitly deferred**:

- ❌ Any DJI SDK integration
- ❌ Any photogrammetry pipeline
- ❌ Any real radiometric thermal ingest
- ❌ Any CAD/BIM generator
- ❌ Real materials/labor DB
- ❌ Habitat platform itself (only the sync surface)
- ❌ SSO
- ❌ Payments live checkout
- ❌ Multi-tenant migration (deferred to Phase 2)

Every one of the above is labeled **AWAITING INTEGRATION** in the UI. No exceptions.

15. IMPLEMENTATION SEQUENCE (once blueprint is approved)

Phase 1a — Legacy Freeze (1 session)

- 1. Create `/app/frontend/src/legacy/` and move every existing page there
- 2. Create `/app/backend/routes/legacy/` mirroring same
- 3. Prefix all legacy routes with `/legacy/*`
- 4. Delete `Andrew` page (✅ done)
- 5. Snapshot preserved as read-only reference

Phase 1b — NextGen Shell (1-2 sessions)

- 1. `/app/frontend/src/nextgen/` root

- 2. Persistent operator shell (top command bar, left nav, provenance-aware page frame)
- 3. All 14 modules as route stubs — every workspace exists, most show "AWAITING INTEGRATION"
- 4. Provenance chip component (shared)
- 5. Cross AI + Stratex logo lockup in the shell

**Phase 1c — Workspace Stubs** (1-2 sessions)

- 1. Mission Control · Property Portfolio · Missions · Digital Twin Studio · AI Workforce · AWE™ Intelligence · Estimating · Reporting · Human QA · Integrations · System
- 2. Every workspace has: hero, workflow-step indicator, provenance chips wired to real backend state (using existing endpoints)
- 3. Live workflow chain visible from any workspace

**Phase 1d — Screenshot + Executive Review Package** (final)

- 1. Screenshot every workspace on desktop + iPhone
- 2. Bundle blueprint + screenshots + review as a single deliverable
- 3. Request executive approval before Phase 2

---

**16. APPROVAL BLOCK**

Executive approval required before Phase 1b begins.

- ☐ Blueprint reviewed by Anthony Cross
- ☐ Executive Architecture Review reviewed
- ☐ Phase 1 acceptance criteria confirmed
- ☐ Authorized to proceed to Phase 1a implementation

Signature: \_\_\_\_\_ Date: \_\_\_\_\_

---

**STRATEX CORE — NEXTGEN ARCHITECTURE REVIEW APPENDIX**

Companion document to NEXTGEN\_ARCHITECTURE\_BLUEPRINT.md v1.0

**Status:** Answering Executive Review Questions 1-14

**Author:** TC · Stratex AI Product Manager, under directive of Anthony Cross

**Purpose:** Detailed responses to executive architecture review questions issued during the Blueprint hold.

---

**Q1 — TWENTY-FOUR-AGENT ARCHITECTURE (justification)**

**Correction of framing**

The blueprint's "24 agents" is a **logical software role count**, not a deployable-service count. In production, these logical agents collapse into **5 deployable services** during early phases:

| SERVICE                         | LOGICAL AGENTS INSIDE                                                                                              | DEPLOYMENT                                 |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| **Mission Ops Service**         | Mission Commander · Mission QA · Flight Operations · Mission Assurance · Capture Validation                        | 1 container, sync + background             |
| **Vision Intelligence Service** | Photogrammetry · CAD/BIM · Digital Twin · Roof · Window · Door · Damage Detection · Measurement · Thermal Analysis | 1 container, GPU-optional, async job queue |
| **AWE Intelligence Service**    | Water · Air · Energy                                                                                               | 1 container, async job queue               |
| **Estimating Service**          | Materials · Labor · Estimating · Maintenance Priority                                                              | 1 container, sync                          |
| **Delivery & Sync Service**     | Reporting · Passport Sync · Habitat Sync                                                                           | 1 container, sync + retry queue            |

**Rationale:** separately deploying 24 microservices during the prototype phase would introduce network complexity, deployment cost, and observability burden with no operational payoff.

## Per-agent detail table

| #  | AGENT                    | RESPONSIBILITY                                    | INPUTS                                    | OUTPUTS                           | MODEL / SERVICE                                                  | LOGICAL VS DEPLOYED        | SYNC/ASYN       | HUMAN GATE          | COST TIER |
|----|--------------------------|---------------------------------------------------|-------------------------------------------|-----------------------------------|------------------------------------------------------------------|----------------------------|-----------------|---------------------|-----------|
| 1  | Mission Commander        | Compose + validate mission plan                   | property_id, target_systems               | mission_plan.json                 | Claude Sonnet + rule engine                                      | Logical inside Mission Ops | Sync            | Yes (dispatcher)    | Low       |
| 2  | Mission QA               | Enforce 20-item preflight gate                    | mission_plan, drone_state, weather        | gate_result{pass,fail,blockers[]} | Deterministic checks                                             | Logical                    | Sync            | No (all-or-nothing) | Free      |
| 3  | Flight Operations        | Live telemetry watch; safe-return decisions       | telemetry stream                          | control_decisions[]               | Rule engine                                                      | Logical                    | Async streaming | Escalates           | Low       |
| 4  | Mission Assurance        | In-flight GSD/overlap QA                          | live imagery metadata                     | additional_shots[]                | Statistical + Claude                                             | Logical                    | Async streaming | No (auto-rotate)    | Low       |

### Combination rationale

Agents 13-15 (AWE) cannot be combined because Water, Air, and Energy each require distinct

input signals (weather history vs door/window vs envelope) and produce independently-reported scores.

Similarly, Roof/Window/Door intelligences cannot be combined because approval authority

differs (a contractor may approve roof findings but require an engineer for structural doors).

## Q2 — PROPERTY PASSPORT AUTHORITY

### Ownership model (definitive)

| CONCERN                              | AUTHORITY                                                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>**Creates Passport**</b>          | Stratex Passport service — issued via `POST /passport/v1/mint` with a nonce from Core                                                                             |
| <b>**Owns canonical identifier**</b> | Stratex Passport service — 12-char uppercase hash, globally unique                                                                                                |
| <b>**May append records**</b>        | <b>**Stratex Passport service only.**</b> Core submits deltas via `/passport/v1/append`; Passport service re-verifies chain integrity before writing              |
| <b>**May correct records**</b>       | Nobody. Records are immutable. Corrections are new appends with an explicit `supersedes` pointer to the prior record                                              |
| <b>**Versioned via**</b>             | Sequential ledger `seq` + SHA-256 chain (`prev_hash` field) — already implemented today for the native passport                                                   |
| <b>**Findings superseded via**</b>   | New ledger entry of type `SUPERSEDE` carrying `prior_seq`, `reason`, and `superseding_finding_id`. Historical record is never destroyed                           |
| <b>**Core submission path**</b>      | `POST /passport/v1/append {passport_id, delta_bundle, core_signature}` → Passport verifies + writes + returns cryptographic receipt                               |
| <b>**Habitat receipt path**</b>      | `GET /passport/v1/projections/homeowner/:passport_id` — a read-only projection scoped to homeowner-appropriate fields                                             |
| <b>**Conflict resolution**</b>       | <b>**First-writer-wins with per-property sequence numbers.**</b> Concurrent appends fail with `409 SEQUENCE_CONFLICT`, forcing the loser to re-read and re-submit |
| <b>**Cryptographic proof**</b>       | Every accepted append returns a SHA-256 receipt computed over `{payload, seq, prev_hash, signed_at}`. Core stores this receipt in its `sync_audit_log`            |
| <b>**Deployment**</b>                | <b>**Standalone service**</b> post-parity. Today it is embedded in `/app/backend/routes/passport.py` — this is the first module extracted in Phase 2              |

Access-control matrix

| ACTOR                   | READ                                          | APPEND                                   | CORRECT                     | HABITAT RECEIVE |
|-------------------------|-----------------------------------------------|------------------------------------------|-----------------------------|-----------------|
| Contractor (Core)       | ✔ (their org's properties)                    | ✔ (approved bundles only)                | ✗                           | ✗               |
| Homeowner               | ✔ (their property only, homeowner projection) | ✗                                        | ✗                           | ✔               |
| Adjuster                | ✔ (via magic link)                            | ✔ (cosign entries only — already exists) | ✗                           | ✗               |
| Passport service itself | ✔                                             | ✔ (all writes go through it)             | ✔ (via SUPERSEDE semantics) | —               |
| Habitat service         | ✗ direct                                      | ✗                                        | ✗                           | ✔ pull only     |

Existing Claim Snapshot cosign receipt pattern (§8 blueprint) is the canonical template for how every future append works.

Q3 — PROVENANCE INTERFACE

Visual-noise avoidance rules

Always visible (chip in-line) — applies to high-consequence numbers only:

- Envelope Score
- Moisture %
- Repair Estimate \$
- AWE™ scores (Air, Water, Energy)
- Truth Score
- Confidence %

Progressive disclosure — for supporting values:

- Every measurement (dimension, count, area) shows a small colored dot only
- Tap / hover reveals a hover-card with the full provenance object
- "Open Evidence" button in the hover-card drops into an Evidence Drawer

Mobile behavior:

- Chips shrink to a single colored dot (4px) on ≤430 px viewports
- Long-press opens the provenance drawer (not hover)
- Drawer takes 90% of screen height, dismissible with swipe-down

Evidence Drawer contents:

- Source asset thumbnail (with a "view full size" affordance)
- Model + version + prompt version
- Confidence, timestamp, signer (if human-approved)
- "Reject / Escalate" affordance if the user has QA role

Provenance vs Confidence vs Truth Score (clarified)

| CONCEPT                | QUESTION IT ANSWERS                                                          |
|------------------------|------------------------------------------------------------------------------|
| **Provenance**         | *Where did this value come from?* — Source lineage                           |
| **Confidence**         | *How sure is the model / measurement?* — Per-agent numeric or human-verified |
| **Finding confidence** | Aggregate confidence across all inputs for a single finding                  |
| **Truth Score**        | *How trustworthy is this entire property record?* — See Q4                   |

## Q4 — TRUTH SCORE (honest specification)

### Definition (revised, non-marketing)

Truth Score is a **composite property-record trust indicator**, expressed on a 0-100 scale in **10-point bands** (never in decimal form) with descriptive language:

| BAND   | LANGUAGE                               |
|--------|----------------------------------------|
| 90-100 | **Field-verified · production-grade**  |
| 70-89  | **AI-assisted · human-approved**       |
| 50-69  | **AI-assisted · pending human review** |
| 30-49  | **Partial coverage**                   |
| 0-29   | **Insufficient evidence**              |

### Component inputs

1. **Evidence coverage** (0-30 pts) — fraction of expected asset types present (RGB, thermal, dimensional)
2. **Model confidence average** (0-25 pts) — mean confidence of all findings
3. **Human verification ratio** (0-25 pts) — % of findings signed by human QA
4. **Recency** (0-10 pts) — age of freshest scan
5. **Cross-registration** (0-10 pts) — RGB ↔ thermal alignment score (if AWE performed)

### Weighting

Deterministic weighted sum with published coefficients — never a model output.

### Missing-evidence behavior

Missing evidence subtracts from Evidence Coverage. Never treated as "confident zero."

### Contradictory-evidence behavior

Contradictions between two findings trigger a **CONTRADICTION** event that:

- caps Truth Score at 60 until reconciled
- surfaces both findings to the Human QA queue

### Human verification effect

Each human-approved finding contributes to the Human Verification Ratio component. A property with 100% human approval on all findings can reach the 90-100 band.

### Versioning

Truth Score has its own version number (e.g. **TS.v1.0**). Historical scores are frozen in the passport ledger.

### Calibration

Requires empirical field-verification runs against ground truth before we publish the score externally. Until then, the score is displayed with the label **"Prototype scoring — not calibrated to industry standard yet."**

### Display language rules

- **Prohibited:** "97.43%," "99.7% accurate," "AI-verified truth."
- **Required:** 10-point band + descriptive label + provenance chip

### Marketing restrictions

- Truth Score may **not** be presented to insurance carriers or in contracts as a warranty of accuracy until calibration is published.
- May be presented **only** as a "record-completeness signal" during the prototype phase.

The four levels distinguished

| LEVEL                  | SCOPE                                                                     |
|------------------------|---------------------------------------------------------------------------|
| Model confidence       | Per-inference (one AI call)                                               |
| Measurement confidence | Per-measurement (one dimension)                                           |
| Finding confidence     | Per-finding (composite of contributing model + measurement confidences)   |
| **Truth Score**        | Per-property record (composite of all findings + coverage + verification) |

Q5 — AWE™ MISSION SEPARATION

Recognized: AWE requires a separate mission

The blueprint is amended: AWE™ is **not a processing toggle on daytime imagery**. Three explicit mission products exist:

Product 1 · Stratex Core DayScan™

- **When:** daytime, dry conditions
- **Captures:** RGB imagery only
- **Produces:** measurements, roof/exterior geometry, damage imagery, Digital Twin (Reality + CAD layers), material quantities, DayScan report
- **Updates:** Property Passport DayScan chain

Product 2 · Stratex AWE™ Scan

- **When:** nighttime, only when environmental eligibility passes:
- $\Delta T$  between indoor and outdoor  $\geq 15^{\circ}\text{F}$  (configurable per region)
- No rain within last 4 hours
- Wind  $< 15$  mph
- Humidity  $< 80\%$
- No direct solar loading ( $\geq 1$  hour past sunset)
- **Captures:** radiometric thermal + reference RGB
- **Produces:** Air / Water / Energy findings with false-positive controls (moisture-mimic exclusion, ventilation-shadow rejection)
- **Requires:** field verification for any finding above a materiality threshold before Passport entry
- **Updates:** Property Passport AWE chain

Product 3 · Stratex Elite™ Property Intelligence

- Combines DayScan + AWE Scan (with cross-registration between RGB and thermal datasets)
- Produces unified evidence graph, combined report, **AWE Index™** (composite Air/Water/Energy)
- Updates Property Passport with a single approved bundle referencing both scan hashes

Mission planner enforcement

The Mission Planner (§3 blueprint) must present the operator with a **product selector** as the first step: DayScan vs AWE Scan vs Elite. The 20-item ATC gate then loads the product-specific validation subset.

## Q6 — DIGITAL TWIN ARCHITECTURE

### Canonical decisions

| CONCERN                                   | DECISION                                                                                                                                                                              |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>**Coordinate system**</b>              | WGS84 lat/lon + local ENU (East-North-Up) origin per property; twin is stored in local ENU with a lat/lon origin pin                                                                  |
| <b>**Geometry source**</b>                | Photogrammetry point cloud + mesh (from RGB) — <b>**AWAITING INTEGRATION**</b>                                                                                                        |
| <b>**RGB texture source**</b>             | DayScan RGB assets                                                                                                                                                                    |
| <b>**Thermal-to-RGB registration**</b>    | Feature-based homography per capture; per-pixel registration confidence stored                                                                                                        |
| <b>**Layer manifest**</b>                 | JSON manifest listing each layer (Reality, CAD, Intelligence) with URIs, hashes, version                                                                                              |
| <b>**Formats**</b>                        | Storage: glTF 2.0 (`.glb`) canonical; IFC 4 and DXF for CAD; PLY for point clouds; radiometric TIFF for thermal source                                                                |
| <b>**Measurement provenance**</b>         | Every extracted measurement carries `derived_from: [asset_ids]` + tolerance $\pm$ value                                                                                               |
| <b>**Level-of-detail**</b>                | glTF LOD hierarchy: L0 (full), L1 (medium), L2 (mobile); browser streams L2 by default, promotes to L0 on zoom                                                                        |
| <b>**Version comparison**</b>             | Two twin versions can be diffed; findings that shift receive a `DIFF` event                                                                                                           |
| <b>**Browser streaming**</b>              | glTF over HTTPS with Draco compression + KTX2 textures                                                                                                                                |
| <b>**Mobile performance**</b>             | L2 mesh + 1k textures target < 20 MB total; renders on iPhone 12 and later at 60 fps                                                                                                  |
| <b>**Vendor-neutral storage**</b>         | S3-compatible object storage. No vendor-specific format inside the canonical bundle                                                                                                   |
| <b>**Exportability**</b>                  | Every twin can be exported as `.glb` + `.ifc` + `.dxf` bundle to a customer download link                                                                                             |
| <b>**External processor replacement**</b> | Photogrammetry, CAD/BIM, and radiometric processing are all <b>**adapter contracts**</b> . Concrete provider (Pix4D, RealityCapture, OpenDroneMap) is swappable without changing Core |

### Stratex-owned vs external-processor-owned

#### Stratex owns forever:

- Mission package (plan, waypoints, targets)
- Evidence graph (which asset produced which finding)
- Findings + approvals + Passport records
- The layer manifest and its version history
- Signed measurement provenance

**External processors own only** the raw mesh/CAD generation step and are treated as replaceable adapters behind a `PhotogrammetryProvider` / `BimProvider` interface.

## Q7 — DATA-STATE HONESTY

### Adopted implementation-state vocabulary

Every feature, integration, and displayed value shall carry exactly one of:

| STATE                            | MEANING                                                                  |
|----------------------------------|--------------------------------------------------------------------------|
| <b>**Operational**</b>           | Live end-to-end in production, verified by tests                         |
| <b>**Partially operational**</b> | Some flows live, others use fallback or fixtures — clearly labeled which |
| <b>**Mocked**</b>                | Fixture data; nothing real behind it                                     |
| <b>**Planned**</b>               | Design complete, not built                                               |
| <b>**Awaiting credentials**</b>  | Built but requires API key / license not yet obtained                    |
| <b>**Awaiting hardware**</b>     | Built but requires drone / sensor / dock not yet on hand                 |
| <b>**Awaiting validation**</b>   | Built but requires field calibration before trust                        |
| <b>**Deprecated**</b>            | Phasing out; do not use for new work                                     |
| <b>**Legacy**</b>                | Frozen, read-only, under `/legacy/*`                                     |

### Marketing rules

- No screen may claim "operational" for a component that is any other state
- The UI shall render each state with a distinct chip color and label
- Reports shall footer with a state summary of every value in the document

## Q8 — EXISTING ASSET PRESERVATION MAP

| ASSET                                                                           | DECISION                                                                                            | RATIONALE                                      |
|---------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|------------------------------------------------|
| Official Stratex branding (logo, colors, typography)                            | <b>**Preserve unchanged**</b>                                                                       | Approved; carried into NextGen shell           |
| Property Passport ledger (hash-chained)                                         | <b>**Preserve unchanged**</b> , migrate storage to `passport_ledger` collection with Pydantic model | Working crypto — do not touch the algorithm    |
| Claim Snapshot engine                                                           | <b>**Refactor**</b> into `findings` + specialized `claim_snapshot` view; keep public API            | Genuine value; needs normalized storage        |
| Adjuster co-sign SHA-256 receipt                                                | <b>**Preserve**</b> as the canonical template for all future human sign-offs                        | Generalize the pattern to every Human QA event |
| Open-Meteo weather integration                                                  | <b>**Preserve unchanged**</b> ; extract into `WeatherProvider` adapter                              | Simple, working, free                          |
| Live Ops WebSocket bus                                                          | <b>**Refactor**</b> onto formal event bus (\$7 blueprint); keep client contract                     | WS is fine; server logic needs event log       |
| PDF / Report pipeline (Playwright + cache-first)                                | <b>**Preserve**</b> ; graduate to Report Studio in Delivery Service                                 | Production-safe already                        |
| Reports Binder (PyMuPDF)                                                        | <b>**Preserve**</b> as embedded viewer in Report Studio                                             | Works                                          |
| Existing authentication (JWT + bcrypt, CEO login)                               | <b>**Refactor**</b> — extract to Identity Service, expand to full RBAC                              | Foundation good; scope must grow               |
| Existing authorization                                                          | <b>**Refactor**</b> — introduce `require_auth` + `require_org` on all product routes                | Critical gap today                             |
| Service credentials / HMAC patterns                                             | <b>**Preserve**</b> patterns; regenerate secrets on each service split                              | Reusable                                       |
| Existing Core → Passport → Habitat contracts                                    | <b>**Migrate**</b> — Passport becomes standalone; Habitat contract is new                           | Formalized in Q2                               |
| Existing test suites (`test_iter17_new_features.py` ... `test_iter21_csign.py`) | <b>**Preserve**</b> as legacy regression harness; add NextGen suite alongside                       | Keep the safety net                            |
| Static illustrations in `twin/*` and `_binder_cache/*`                          | <b>**Retire**</b> once real twin renders exist, but keep for the interim label as `DEMO DATA`       | Cannot be shown as real intelligence           |
| `_sample_analysis()` hardcoded fixture                                          | <b>**Retire**</b> — replaced by the AI Workforce pipeline                                           | Explicit deletion at Phase 3                   |

**Nothing is deleted through omission.** Every asset is accounted for.

## Q9 — SECURITY SCOPE (phased introduction)

---

### Phase 1 (Foundation)

- **Initial roles:** `admin`, `contractor`, `pilot`, `inspector`, `homeowner`, `adjuster`
- **Initial permissions:** read/write/approve/sign
- **Organization isolation:** `org_id` required on every mutable resource; enforced in query builder
- **Property-level access:** `property_org_bindings` table; contractors see only their org's properties
- **Contractor access:** read all properties in their org, write findings after inspector approval
- **Homeowner access:** read-only projection of their property only
- **Pilot / operator access:** read mission plans, write telemetry + capture assets
- **Administrator access:** full within their org; cross-org requires service token
- **Engineer/adjuster reviewer access:** read + sign findings/reports via magic-link tokens (existing cosign pattern)

### Service-to-service authorization

- mTLS between Core ↔ Passport ↔ Habitat (Phase 2+)
- Short-lived service tokens with per-endpoint scopes

### Audit logging

- Every mutation → `audit_events` (actor, action, resource, before, after)
- Retention: 2 years hot, 7 years cold storage — **AWAITING INTEGRATION**

### Secrets management

- All secrets in `.env` today
- Move to Emergent-managed secret store or HashiCorp Vault (Phase 5)

### Rate limiting

- Per-user + per-IP token buckets on all public endpoints
- Passport, cosign, storm APIs: 60 req/min per IP; 300 per authenticated user

### File access

- All object-storage assets served via **signed URLs** with expiry (default 5 min)
- Signed uploads via presigned POST
- Every download logged to `asset_provenance`

### Explicit Phase 1 stops

- No SSO in Phase 1
- No field-level encryption in Phase 1 (Phase 3)
- No SIEM in Phase 1 (Phase 5)

---

## Q10 — DATABASE-DOMAIN JUSTIFICATION

---

**Correction:** the 10 domains described in §4 of the blueprint are **logical modules**, not 10 separate databases. During prototype and MVP phases, all 10 domains live inside a **single MongoDB database** with strict per-collection schemas and boundaries enforced at the application layer.

**Per-domain table**

| DOMAIN                     | PURPOSE                              | CORE ENTITIES                                                                     | OWNERSHIP BOUNDARY                 | TRANSACTIONS                     | RETENTION            | SENSITIVITY           | SEPARATE DB?                                     |
|----------------------------|--------------------------------------|-----------------------------------------------------------------------------------|------------------------------------|----------------------------------|----------------------|-----------------------|--------------------------------------------------|
| Identity & Access          | Auth + RBAC + audit                  | orgs, users, roles, api_keys, audit_events                                        | Identity Service                   | ACID-lite (Mongo multi-doc tx)   | 7 yrs (audit)        | HIGH (PII)            | No — logical only                                |
| Property Registry          | Canonical property record            | properties, addresses, parcels, owners, contractors                               | Property Service                   | Multi-doc tx on write            | Permanent            | MEDIUM (PII)          | No                                               |
| Mission Operations         | Mission lifecycle                    | missions, mission_plans, mission_validations, mission_telemetry, capture_sessions | Mission Ops Service                | Sequential per mission           | 3 yrs                | LOW-MEDIUM            | No                                               |
| Capture Assets             | Binary asset metadata (binary in S3) | assets, asset_derivatives, asset_provenance                                       | Vision Service                     | Metadata only                    | 7 yrs (bodies in S3) | MEDIUM                | No (metadata) / Yes (S3 binaries)                |
| Intelligence Findings      | AI + human findings                  | findings, finding_evidence, finding_confidence, agent_runs                        | Vision + AWE + Estimating Services | Append-only ledger-like          | Permanent            | MEDIUM                | No                                               |
| AWE™ Metrics               | AWE readings + scores                | awe_readings, awe_scores, awe_history                                             | AWE Service                        | Sequential per property          | Permanent            | LOW                   | No                                               |
| Estimating                 | Materials + labor + estimates        | materials_catalog, labor_catalog, estimates, estimate_versions                    | Estimating Service                 | Versioned; last-write-wins       | Permanent            | LOW-MEDIUM (business) | No                                               |
| Reports & Deliverables     | Rendered reports                     | report_templates, reports, report_versions, report_signatures                     | Delivery Service                   | Sequential                       | Permanent            | LOW                   | No                                               |
| Passport & Habitat Sync    | Sync audit + queue                   | passport_ledger, passport_sync_log, habitat_sync_log, sync_retry_queue            | Passport Service                   | Ledger append + idempotent queue | Permanent            | HIGH (cryptographic)  | **Yes** — Passport becomes standalone in Phase 2 |
| Compliance & Observability | Provenance, events, cost             | provenance_chain, event_log, error_events, cost_ledger                            | Platform                           | Append-only                      | 2 yrs hot            | LOW                   | No                                               |

**Only the Passport domain justifies extraction into a separate database (Phase 2)** — because its records are the immutable source of truth for all downstream systems. Everything else remains logical modules inside the primary Mongo database until scale demands otherwise.

**Q11 — API-PLANE JUSTIFICATION**

**Correction:** the 5 planes are **logical route-prefix conventions with distinct middleware chains**, not 5 separate network services. All planes run inside the same FastAPI app initially; some may split later.

Per-plane table

| PLANE           | PREFIX            | CONSUMERS                            | AUTH                 | AUTHZ                             | VERSIONING    | RATE LIMITS            | ERRORS                            | IDEMPOTENCY                        | AUDIT                      | NETWORK BOUNDARY?                                   |
|-----------------|-------------------|--------------------------------------|----------------------|-----------------------------------|---------------|------------------------|-----------------------------------|------------------------------------|----------------------------|-----------------------------------------------------|
| **Public Read** | `/api/pub/v1/`    | Anonymous (via passport hash)        | Signed URL / hash    | Resource-level                    | URL versioned | 60/min/IP              | RFC 7807 JSON                     | GET only                           | Read log to `audit_events` | No (same process, edge-cacheable)                   |
| **Product**     | `/api/v1/`        | Authenticated users                  | JWT                  | RBAC + ABAC (org, property, role) | URL versioned | 300/min/user           | RFC 7807                          | Idempotency-Key header on POST/PUT | Full audit                 | No (same process)                                   |
| **Agent**       | `/api/agents/v1/` | Backend agent runners                | Service token        | Scope-per-endpoint                | URL versioned | Internal only          | RFC 7807                          | Idempotency-Key required           | agent_runs table           | **Yes** — internal network only, blocked at ingress |
| **Sync**        | `/api/sync/v1/`   | Passport, Habitat services           | mTLS + service token | Service allow-list                | URL versioned | Bounded by queue depth | RFC 7807 + retry semantics        | Idempotency-Key required           | Full audit                 | **Yes** (Phase 2+)                                  |
| **Webhook**     | `/api/hooks/v1/`  | External inbound (DJI, FAA, weather) | HMAC signature       | Provider allow-list               | URL versioned | Provider quotas        | 202 on accept, HMAC failure → 401 | Idempotency by event id            | Full audit                 | No (same process)                                   |

Actual network boundaries introduced only where necessary — Agent and Sync are gated at the ingress layer. Everything else is logical.

Q12 — EVENT-DRIVEN ARCHITECTURE (Phase 1 events only)

Phase 1 minimum viable event set

Only these events are wired in Phase 1. All others are deferred until real workflows demand them.

| EVENT               | PRODUCER               | CONSUMER                    | PAYLOAD                             | IDEMPOTENCY KEY    | RETRY          | FAILURE                         | DLQ | AUDIT                    | SYNC ALTERNATIVE?            |
|---------------------|------------------------|-----------------------------|-------------------------------------|--------------------|----------------|---------------------------------|-----|--------------------------|------------------------------|
| `mission.planned`   | Mission Ops            | Mission Validation          | mission_id, plan                    | mission_id         | 3× exp backoff | Log + surface in Mission Ops UI | Yes | audit_events + event_log | Sync is fine; keep async     |
| `mission.validated` | Mission Validation     | Mission Ops (unlock launch) | mission_id, pass/fail, gate_details | mission_id         | none           | Block launch                    | No  | audit_events             | Sync (immediate)             |
| `capture.received`  | Vision (adapter)       | Vision Service              | mission_id, asset_bundle_id         | asset_bundle_id    | 3×             | Escalate to Human QA            | Yes | audit_events + event_log | Async needed (large uploads) |
| `finding.produced`  | Any AI agent           | Human QA                    | finding_id, agent_id, confidence    | finding_id         | none           | Halt Passport append            | No  | agent_runs               | Sync (blocks Passport)       |
| `finding.approved`  | Human QA               | Passport Sync               | finding_id, signer, receipt         | finding_id         | none           | Halt sync                       | No  | audit_events             | Sync (blocks sync)           |
| `passport.appended` | Passport Service       | Habitat Sync                | passport_id, seq, receipt_hash      | (passport_id, seq) | 3×             | sync_retry_queue                | Yes | passport_sync_log        | Async (external system)      |
| `habitat.received`  | Habitat (webhook back) | Passport Sync               | passport_id, seq, ack               | (passport_id, seq) | —              | Alert ops                       | Yes | habitat_sync_log         | Async (ack)                  |

No full event-bus infrastructure in Phase 1. These events are recorded in `event_log` and dispatched via in-process async tasks (FastAPI background tasks). If cross-service messaging becomes necessary in Phase 2+, we upgrade to a proper broker (NATS or Redis Streams) — not before.

Q13 — TECHNOLOGY DECISIONS (justified)

| TECH                       | PROBLEM SOLVED                                                   | WHY EXISTING IS INSUFFICIENT                                                                      | ADOPTION COST                           | MIGRATION RISK                | SIMPLER ALTERNATIVE                          | NECESSARY IN PHASE                 |
|----------------------------|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|-----------------------------------------|-------------------------------|----------------------------------------------|------------------------------------|
| **React Query**            | Server-state caching, retries, background refresh, optimistic UI | Current app uses ad-hoc `useEffect` + `fetch`; race conditions and stale data are already visible | Low (drop-in; ~1 day)                   | Low (per-page adoption)       | Continue with useEffect (rejected — bugs)    | Phase 1b                           |
| **Zustand**                | Small global UI state (e.g. current mission, active twin layer)  | React Context works but rerenders too much                                                        | Very low                                | None                          | Redux (too heavy); Context (already present) | Phase 1b                           |
| **Event-driven backbone**  | Decoupling AI pipeline stages                                    | Current code is deeply coupled (`storm_watcher` reaches into passport internals)                  | Medium                                  | Medium                        | Sync in-process only (acceptable in Phase 1) | **Deferred to Phase 2**            |
| **Blue/green deployment**  | Zero-downtime cutovers                                           | Emergent single-container deploys create brief unavailability                                     | Low (Emergent may not support natively) | Low                           | Just rollback via checkpoint (fine for now)  | **Deferred to Phase 5**            |
| **Feature flags**          | Ship stubs safely, control AWAITING INTEGRATION states           | Currently commenting out code                                                                     | Low (implement in-house)                | None                          | Env vars (works but less granular)           | Phase 1b (in-house key-value flag) |
| **Cryptographic receipts** | Prove what was submitted / approved                              | Already implemented (cosign) — extend the pattern                                                 | Free (already exists)                   | None                          | (already chosen)                             | Phase 1 (existing)                 |
| **RBAC**                   | Role-based access control                                        | Current app has none on product routes                                                            | Medium (~1 week)                        | Medium (retrofit every route) | ACLs only (too rigid)                        | Phase 1 mandatory                  |
| **ABAC overlay**           | Property/org-level access rules                                  | RBAC alone can't gate by `property_org_binding`                                                   | Low on top of RBAC                      | Low                           | RBAC-only (rejected — leaks data)            | Phase 2                            |

Rejected in this round

- **Kubernetes multi-cluster**: unjustified until scale demands
- **Kafka**: overkill; NATS/Redis Streams sufficient when we need a broker
- **GraphQL**: REST + tight schemas is sufficient
- **Rust rewrite of any component**: no
- **Any new frontend framework**: React is the standard here

Q14 — PHASE 1 SCOPE CONTROL (explicit)

Phase 1 creates the architecture and operating shell but delivers no finished production intelligence engines.

Phase 1 SHALL establish (deliverable list)

1. Application boundaries (Production / NextGen / Legacy)
2. Navigation (14 modules, canonical routes)
3. Workflow state machine (14-stage mandatory chain)
4. Mission shell (Mission Ops workspace stubs)
5. Property shell (Property Portfolio + Property Detail with tabs)
6. Evidence schema (asset ↔ finding ↔ approval)
7. Provenance schema (chip component + backing data model)
8. Agent-run audit schema (`agent_runs` collection)
9. Passport contract (Q2 above)
10. Habitat synchronization contract (§8 blueprint + Q2)

- 11. Digital Twin layer contract (Q6)
- 12. AWE mission contract (Q5)
- 13. Design-system foundation (tokens, provenance chip, module frame)
- 14. Security foundation (RBAC skeleton, `require_auth` middleware)
- 15. Test strategy (regression harness plan)

Phase 1 SHALL NOT claim to deliver

- Production-ready photogrammetry
- Production-ready thermal diagnosis
- Automated CAD/BIM generation
- Field-validated AWE conclusions
- Automated damage classification with contract-grade accuracy
- Any measurement presented as production-truth without human sign-off

Every screen in Phase 1 delivering intelligence content shall wear one of these labels:

DEMO · DATA · MOCKED · AWAITING INTEGRATION · AWAITING HARDWARE · AWAITING VALIDATION

Success criteria (Phase 1 exit gate)

- All 14 items above delivered
- Blueprint + Appendix + Executive Review signed off
- Screenshots of every workspace captured on desktop + mobile
- Regression suite green
- Zero fabricated intelligence displayed in the shell

APPENDIX — REVISION HISTORY
